

Activity Participation Percentage Trend (1999-2009)

	1999	2004	2009
Tennis	25%	30%	33%
Swimming	32%	34%	34%
Football	57%	52%	48%
Volleyball	8%	13%	17%
Basketball	26%	25%	24%
Yoga	10%	10%	13%

Source: Annual Activity Surveys

The table illustrates the proportion of participants engaged in six sporting activities in a European country, as recorded across three survey years: 1999, 2004, and 2009. Overall, football remained the most widely practiced activity throughout, though it experienced a steady decline, while minority sports such as tennis, volleyball, and yoga recorded consistent growth over the same period.

Football's dominance was unambiguous, yet its trajectory was distinctly downward, falling from 57% in 1999 to 52% five years later, and further to 48% by 2009 - a net decline of 9 percentage points across the decade. Swimming, by contrast, held comparatively stable, rising marginally from 32% to 34% by 2004 and remaining unchanged thereafter. Basketball followed a similarly flat but slightly downward trend, edging down from 26% to 24% over the full period.

The most notable growth was recorded among the lower-participation activities. Volleyball more than doubled its modest base, climbing from just 8% in 1999 to 17% by 2009, representing the largest relative increase of any sport in the table. Tennis also grew steadily, rising from 25% to 33% over the period shown. Yoga, despite remaining among the least practiced activities, saw its share increase from 10% to 13% between 2004 and 2009, having stagnated in the first half of the period.
